

Day 20

Final Presentation

Learning Objectives:

- Present your project work professionally to trainer and peers
- Demonstrate understanding of the full PM lifecycle through your deliverables
- Give and receive constructive feedback
- Reflect on growth across 20 days
- **YouTube Search Terms:**
 - "How to present a project as a PM"
 - "Presentation skills for project managers"
 - "Storytelling with data for PMs"
- **Recommended Channels:**
 - ProjectManager.com
 - TED
 - Google Project Management Certificate

Tasks:

- Prepare a 15-slide presentation covering your entire internship journey — start with the project you managed (Expense Tracker app), walk through the BRD and PRD, show your Jira board and how sprints progressed, present key documents (Risk Register, RAID Log, Change Requests), show one status report and explain the RAG status you chose, and close with 3 key PM lessons you will carry forward
- Rehearse presenting each slide in 1 minute — the full presentation should be 15 minutes — practice explaining your decisions, not just showing documents — a PM must be able to justify every choice they made
- Prepare for 5 minutes of Q&A by anticipating the 5 hardest questions a trainer could ask — why did you set that scope, how would you handle a team member missing the standup every day, what would you do if the client rejected the Sprint Review demo, how did you prioritize the backlog, and what would you do differently
- Write a personal reflection document covering what you understood about PM before Day 1 vs what you understand now, the single most important thing you learned, the skill you still want to develop, and the type of PM role you want to work toward

Deliverable

- 15-slide presentation (Google Slides link)
- Personal reflection document
- All 20 days of work accessible via GitHub repository link and Google Drive master folder link

Personal Reflection

Project Management Internship

Before Day 1

Before starting this internship, I believed that Project Management was mainly about assigning tasks and tracking deadlines. I had limited knowledge of project planning, documentation, Agile methodology, stakeholder management, and risk handling.

After Completing 20 Days

Over the past 20 days, I gained a much deeper understanding of the complete Project Management lifecycle. I learned how projects move from initiation to planning, execution, monitoring, and closure. I created professional project documents such as the Business Requirements Document (BRD), Product Requirements Document (PRD), Stakeholder Register, Communication Plan, Risk Register, RAID Log, Change Request Log, Status Reports, and Project Closure Report. I also learned Agile practices, including product backlogs, sprint planning, daily stand-ups, sprint reviews, and retrospectives. Working with Jira and GitHub helped me understand how project management tools support collaboration, tracking, and documentation.

The Most Important Lesson I Learned

The most valuable lesson I learned is that successful projects depend on effective planning, clear communication, proactive risk management, and proper documentation. Good project management is not only about completing tasks but also about ensuring that stakeholders remain informed, risks are addressed early, and project goals stay aligned with business objectives.

Skill I Still Want to Develop

Although I have built a strong foundation in documentation and Agile project management, I would like to further improve my stakeholder communication, leadership, conflict resolution, and real-world project execution skills. I also want to gain more hands-on experience managing live software development teams.

My Future Goal

I aim to build my career as an IT Project Manager, leading software development projects using Agile methodologies. I want to continue improving my planning, communication, leadership, and

decision-making skills while managing projects that deliver meaningful value to users and organizations.

Conclusion

This internship has significantly improved my understanding of professional Project Management practices. It has strengthened both my technical and organizational skills, increased my confidence in handling project documentation, and provided practical experience that will help me in future academic and professional projects.
