

DAY 6

Jira: Project Tracking & Backlog Management

Learning Objectives:

- Understand what Jira is and why it is the industry-standard PM tool
- Learn Jira structure: Projects, Epics, Stories, Tasks, Subtasks
- Learn backlog management: creating, prioritizing, and refining the backlog
- Understand issue types, workflows, and how tickets move through a sprint
- **YouTube Search Terms:**
 - "Jira tutorial for beginners complete"
 - "Jira backlog management"
 - "Jira epics stories tasks explained"
 - "How to use Jira as a project manager"
- **Recommended Channels:**
 - Atlassian official
 - SDET Unicorn
 - PM Majik

Tasks:

- Create a free Jira account at atlassian.com — create a new Scrum project called "Expense Tracker App"
- Learn the Jira hierarchy — **Epic (large feature or theme)** → **Story (user requirement)** → **Task (implementation work)** → **Subtask (granular action)** — understand when to use each level
- Create the following in Jira: 3 Epics matching your PRD from Day 4, 10 Stories under those Epics using the user stories you wrote, Tasks under each story breaking down the work, and Priority labels on every item
- Understand **backlog grooming** — the process of reviewing, estimating, and ordering backlog items before a sprint — add story point estimates to each story using Fibonacci numbers (1, 2, 3, 5, 8)
- Move 5 stories from the backlog into a Sprint 1 board — set a sprint goal that clearly states what will be achieved

Deliverable

- Jira project screenshot showing Epics, Stories, and Tasks
- Sprint 1 board screenshot showing stories moved in with estimates
- Short note: difference between a product backlog and a sprint backlog

(Jira project screenshot showing Epics, Stories, and Tasks)

(Sprint 1 board screenshot showing stories moved in with estimates)

Difference Between Product Backlog and Sprint Backlog

Product Backlog	Sprint Backlog
Contains all project requirements	Contains selected items for current sprint
Managed by Product Owner/PM	Managed by Scrum Team
Continuously updated and prioritized	Fixed during the sprint
Long-term project view	Short-term sprint view
May contain hundreds of items	Contains only sprint work

Short Note

The Product Backlog is a master list of all features, enhancements, bug fixes, and requirements for the product. It is continuously refined and prioritized based on business value. The Sprint Backlog is a subset of the Product Backlog containing only the work selected for a specific sprint. While the Product Backlog focuses on the overall product roadmap, the Sprint Backlog focuses on the immediate work that the team commits to completing during the sprint

ADDITIONALS:

1. Sprint (Usually 1-4 Weeks)

A Sprint is a fixed period during which the team works on a set of tasks and delivers a usable product increment.

Example:

If a team is building an online shopping app, Sprint 1 might focus on creating the login and registration features. At the end of the sprint, these features should be completed and ready for testing.

2. Product Backlog

The Product Backlog is a prioritized list of all features, improvements, bug fixes, and requirements for the product.

Example:

- User Registration
- User Login
- Product Search
- Shopping Cart
- Online Payment
- Order Tracking

The Product Owner continuously updates and prioritizes this list.

3. Sprint Backlog

The Sprint Backlog contains the specific tasks selected from the Product Backlog that the team commits to completing during the current sprint.

Example:

For a 2-week sprint, the team may choose:

- Create Login Page
- Build Registration Form
- Connect Database
- Test Authentication Module

4. Daily Standup

A Daily Standup is a short meeting (typically 15 minutes) held every day to track progress and identify blockers.

Each team member answers:

1. What did I complete yesterday?
2. What will I work on today?
3. Are there any obstacles blocking my work?

Example:

- Yesterday: Completed login API.
- Today: Working on registration API.
- Blocker: Need database access permissions.

5. Sprint Review

The Sprint Review takes place at the end of the sprint. The team demonstrates the completed work to stakeholders and gathers feedback.

Example:

The team shows the completed login and registration features to the client. The client requests social media login support, which can be added to the Product Backlog for future sprints.

6. Sprint Retrospective

The Sprint Retrospective is an internal team meeting held after the Sprint Review to discuss what went well, what didn't, and how the team can improve.

Example:

Went Well

- Tasks completed on time
- Good team collaboration

Needs Improvement

- Testing started too late
- Communication delays

Action Items

- Start testing earlier
- Hold technical discussions before development begins

Scrum Flow

Product Backlog → Sprint Planning → Sprint Backlog → Daily Standups → Development Work → Sprint Review → Sprint Retrospective → Next Sprint

Backlog Grooming (Backlog Refinement) is the process of reviewing, updating, prioritizing, and estimating items in the Product Backlog before a sprint. It ensures user stories are clear, properly sized, and ready for development so the team can plan and execute sprints effectively.
